

# Linear Cryptanalysis of the FEAL-4 Cipher

Gokul Krishna Shrikanth  
23266327

FEAL (Fast Data Encipherment Algorithm) is a symmetric key block cipher designed by Akihiro Shimizu and Shoji Miyaguchi in the late 1980s. Linear cryptanalysis is a technique used to analyse the behaviour of a cryptographic algorithm based on linear approximations.

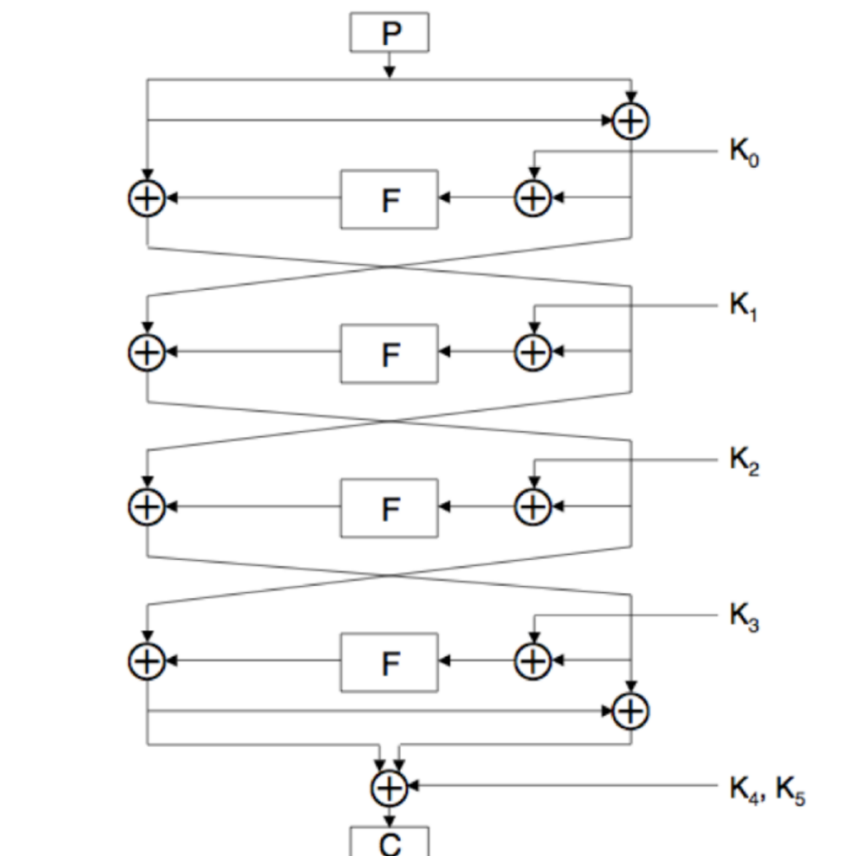

In linear cryptanalysis, the attacker tries to find linear relationships between the plaintext, ciphertext, and key bits. These linear approximations can then be used to derive information about the key by selecting linear expressions and verifying statistical biases in the behaviour of the algorithm.

The equations we can derive from the FEAL 4 cipher can be used to find the keys

$$X0 \text{ xor } Y1 \text{ xor } Y3 = K4 \text{ xor } L4$$

$$L0 \text{ xor } Y0 \text{ xor } Y2 \text{ xor } L4 \text{ xor } K4 = K5 \text{ xor } R4$$

We can compute only the 12 bits instead of the full 32 bits

From this above illustration, We can derive

We also define  $S_{i,j,\dots}(X)$  to be the XOR of bits  $i, j, \dots$  of  $X$ , so  
$$S_{i,j,\dots}(X) = x_i \oplus x_j \oplus \dots$$

And also from the lecture notes we can get the G0 and G1 relationships

Recall that  $G_0$  and  $G_1$  are defined as follows:

$$\begin{aligned} G_0(a, b) &= (a + b \pmod{256}) \lll 2 \\ G_1(a, b) &= (a + b + 1 \pmod{256}) \lll 2 \end{aligned}$$

So the following relationships hold:

- $S_5(G_0(a, b)) = S_7(a \oplus b)$
- $S_5(G_1(a, b)) = S_7(a \oplus b) \oplus 1$

Let  $X$  be the 32-bit input to the round function  $F$ , and  $Y$  be the 32-bit output, so  $Y = F(X)$ . We can then show that the following relationships hold:

1.  $S_{13}(Y) = S_{7,15,23,31}(X) \oplus 1$
2.  $S_{5,15}(Y) = S_7(X)$
3.  $S_{15,21}(Y) = S_{23,31}(X)$
4.  $S_{23,29}(Y) = S_{31}(X) \oplus 1$

The following relationships that we can derive are

$$\begin{aligned} S_{13}(Y) &= S_{7,15}(X) \text{ xor } S_{23,31}(X) \text{ xor } 1 \\ S_5(Y) &= S_{15}(Y) \text{ xor } S_7(X) \\ S_{15}(Y) &= S_{21}(Y) \text{ xor } S_{23,31}(X) \text{ xor } 1 \\ S_{23}(Y) &= S_{29}(Y) \text{ xor } S_{31}(X) \text{ xor } 1 \end{aligned}$$

With the following relations and the formulas we can solve the keys, We will now see how to find the keys K0 to K5

Solving K0:

Since  $L4 = X0 \text{ xor } Y1 \text{ xor } Y3 \text{ xor } K4$  we can get

$$S23,24(L4) = S23,29(X0) \text{ xor } S23,29(Y1) \text{ xor } S23,29(Y3) \text{ xor } S23,39(K4)$$

$$S23,29(X0) = S23,29(L0 \text{ xor } R0)$$

$$S23,29(Y1) = S31(K1) \text{ xor } S31(Y0) \text{ xor } S31(L0) \text{ xor } 1$$

$$S31(Y0) = S31 F(L0 \text{ xor } R0 \text{ xor } K0)$$

$$S23,29(L4) = S23,29(L0 \text{ xor } R0 \text{ xor } L4) \text{ xor } S31(L4 \text{ xor } R4 \text{ xor } L0) \text{ xor } S31 F(L0 \text{ xor } R0 \text{ xor } K0)$$

$$S13(L4 = S13(X0) \text{ xor } S13(Y1) \text{ xor } S13(Y3) \text{ xor } S13(K4)$$

$$S13(X0) = S13(L0 \text{ xor } R0)$$

$$S13(Y3) = S7,15,23,31(L4 \text{ xor } R4) \text{ xor } S7,15,23,31(K4 \text{ xor } K5 \text{ xor } K3) \text{ xor } 1$$

$$S13(Y1) = S7,15,23,31(K1) \text{ xor } S7,15,23,31(Y0) \text{ xor } S7,15,23,31(L0) \text{ xor } 1$$

$$S7,15,23,31(Y0) = S13(L0 \text{ xor } R0 \text{ xor } L4) \text{ xor } S7,15,23,31(L0 \text{ xor } L4 \text{ xor } R4) \text{ xor } S7,15,23,31 F(L0 \text{ xor } R0 \text{ xor } K0)$$

$$S5,15(L4) = S5,15(X0) \text{ xor } S5,15(Y1) \text{ xor } S5,15(Y3) \text{ xor } S5,15(K4)$$

$$S5,15(X0) = S5,15(L0 \text{ xor } R0)$$

$$S5,15(Y3) = S7(L4 \text{ xor } R4) \text{ xor } S7(K4 \text{ xor } K5 \text{ xor } K3) \text{ xor } 1$$

$$S5,15(Y1) = S7(K1) \text{ xor } S7(Y0) \text{ xor } S7(L0) \text{ xor } 1$$

$$S7(Y0) = S7 F(L0 \text{ xor } R0 \text{ xor } K0) = S5,15(L0 \text{ xor } R0 \text{ xor } L4) \text{ xor } S7(L0 \text{ xor } L4 \text{ xor } R4) \text{ xor } S7 F(L0 \text{ xor } R0 \text{ xor } K0)$$

$$S15,21(L4) = S15,21(X0) \text{ xor } S15,21(Y1) \text{ xor } S15,21(Y3) \text{ xor } S15,21(K4)$$

$$S15,21(X0) = S15,21(L0 \text{ xor } R0)$$

$$S15,21(Y3) = S23,31(L4 \text{ xor } R4) \text{ xor } S23,31(K4 \text{ xor } K5 \text{ xor } K3) \text{ xor } 1$$

$$S15,21(Y1) = S23,31(K1) \text{ xor } S23,31(Y0) \text{ xor } S23,31(L0) \text{ xor } 1$$

$$S23,31(Y0) = S23,31 F(L0 \text{ xor } R0 \text{ xor } K0)$$

$$= S15,21(L0 \text{ xor } R0 \text{ xor } L4) \text{ xor } S23,31(L0 \text{ xor } L4 \text{ xor } R4) \text{ xor } S23,31 F(L0 \text{ xor } R0 \text{ xor } K0)$$

$$\text{constant1} = S23,29(L0 \text{ xor } R0 \text{ xor } L4) \text{ xor } S31(L4 \text{ xor } R4 \text{ xor } L0) \text{ xor } S31 F(L0 \text{ xor } R0 \text{ xor } K0)$$

$$\text{constant2} = S13(L0 \text{ xor } R0 \text{ xor } L4) \text{ xor } S7,15,23,31(L0 \text{ xor } L4 \text{ xor } R4) \text{ xor } S7,15,23,31 F(L0 \text{ xor } R0 \text{ xor } K0)$$

$$\text{constant3} = S5,15(L0 \text{ xor } R0 \text{ xor } L4) \text{ xor } S7(L0 \text{ xor } L4 \text{ xor } R4) \text{ xor } S7 F(L0 \text{ xor } R0 \text{ xor } K0)$$

$\text{constant4} = S_{15,21}(L_0 \text{ xor } R_0 \text{ xor } L_4) \text{ xor } S_{23,31}(L_0 \text{ xor } L_4 \text{ xor } R_4) \text{ xor } S_{23,31} F(L_0 \text{ xor } R_0 \text{ xor } K_0)$

From the above we can derive

$S_{5,13,21}(L_0 \text{ xor } R_0 \text{ xor } L_4) \text{ xor } S_{15}(L_0 \text{ xor } L_4 \text{ xor } R_4) \text{ xor } S_{15} F(L_0 \text{ xor } R_0 \text{ xor } K_0)$

We first generate all the combinations of the 12 bit keys and then we calculate the value for every text pair to find  $K_0$

Solving  $K_1$ :

After solving  $K_0$ , we know that  $L_0 \text{ xor } Y_0 \text{ xor } Y_2 \text{ xor } L_4 \text{ xor } K_4 = K_5 \text{ xor } R_4$ , From that we get these constant equations:

$S_{23,29}(R_4) = S_{23,29}(L_0) \text{ xor } S_{23,29}(Y_0) \text{ xor } S_{23,29}(Y_2) \text{ xor } S_{23,29}(L_4) \text{ xor } S_{23,29}(K_4) \text{ xor } S_{23,29}(K_5)$

$S_{23,29}(Y_2) = S_{31}(L_0 \text{ xor } R_0) \text{ xor } S_{31}(Y_1) \text{ xor } S_{31}(K_2) \text{ xor } 1$

$S_{31}(Y_1) = S_{31} F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } K_1)$

$S_{23,29}(Y_0) = S_{31}(L_0) \text{ xor } S_{31}(R_0) \text{ xor } S_{31}(K_0) \text{ xor } 1$

$S_{23,29}(L_0 \text{ xor } L_4 \text{ xor } R_4) \text{ xor } S_{31} F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } K_1)$

Solving them gives us the constant eq:

$\text{constant1} = S_{23,29}(L_0 \text{ xor } L_4 \text{ xor } R_4) \text{ xor } S_{31} F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } K_1)$

$\text{constant2} = S_{13}(L_0 \text{ xor } L_4 \text{ xor } R_4) \text{ xor } S_{7,15,23,31} F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } K_1)$

$\text{constant3} = S_{5,15}(L_0 \text{ xor } L_4 \text{ xor } R_4) \text{ xor } S_7 F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } K_1)$

$\text{constant4} = S_{15,21}(L_0 \text{ xor } L_4 \text{ xor } R_4) \text{ xor } S_{23,31} F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } K_1)$

From these we can get

$S_{5,13,21}(L_0 \text{ xor } L_4 \text{ xor } R_4) \text{ xor } S_{15} F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } K_1)$

We calculate  $K_1$  from  $S_{13}(L_0 \text{ xor } L_4 \text{ xor } R_4) \text{ xor } S_{7,15,23,31} F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } K_1)$

Solving  $K_2$ :

Here we can use the formula

$L_4 = X_0 \text{ xor } Y_1 \text{ xor } Y_3 \text{ xor } K_4$

$S_{23,29}(L_4) = S_{23,29}(X_0) \text{ xor } S_{23,29}(Y_1) \text{ xor } S_{23,29}(Y_3) \text{ xor } S_{23,29}(K_4)$

$S_{23,29}(Y_3) = S_{31} F(L_0 \text{ xor } R_0 \text{ xor } F(L_0 \text{ xor } Y_0 \text{ xor } K_1) \text{ xor } K_2) \text{ xor } S_{31}(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0)) \text{ xor } S_{31}(K_3) \text{ xor } 1$

We can derive that

$S_{23,29}(L_0 \text{ xor } R_0 \text{ xor } L_4) \text{ xor } S_{31} F(L_0 \text{ xor } R_0 \text{ xor } F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } K_1) \text{ xor } K_2)$

Finding the constants for  $K_2$

$\text{constant1} = S_{23,29}(L_0 \text{ xor } R_0 \text{ xor } L_4) \text{ xor } S_{31}(F(L_0 \text{ xor } R_0 \text{ xor } F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } K_1) \text{ xor } K_2)$   
 $\text{constant2} = S_{13}(L_0 \text{ xor } R_0 \text{ xor } L_4) \text{ xor } S_{7,15,23,31}(F(L_0 \text{ xor } R_0 \text{ xor } F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } K_1) \text{ xor } K_2)$   
 $\text{constant3} = S_{5,15}(L_0 \text{ xor } R_0 \text{ xor } L_4) \text{ xor } S_7(F(L_0 \text{ xor } R_0 \text{ xor } F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } K_1) \text{ xor } K_2)$   
 $\text{constant4} = S_{15,21}(L_0 \text{ xor } R_0 \text{ xor } L_4) \text{ xor } S_{23,31}(F(L_0 \text{ xor } R_0 \text{ xor } F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } K_1) \text{ xor } K_2)$

Form the above constant equations we can get

$S_{5,13,21}(L_0 \text{ xor } R_0 \text{ xor } L_4) \text{ xor } S_{15}(F(L_0 \text{ xor } R_0 \text{ xor } F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } K_1) \text{ xor } K_2)$

With which we can repeat the same process by generating all the combinations 12 bits and finding the possible key.

Solving K3:

We use this formula

$L_0 \text{ xor } Y_0 \text{ xor } Y_2 \text{ xor } L_4 \text{ xor } K_4 = K_5 \text{ xor } R_4$ , and take  $Y_2$

$Y_2 = F(L_4 \text{ xor } K_4 \text{ xor } Y_3 \text{ xor } K_2)$

$S_{23,29}(L_0 \text{ xor } L_4 \text{ xor } R_4) \text{ xor } S_{23,29}(Y_0) \text{ xor } S_{23,29}(Y_2) \text{ xor } S_{23,29}(K_4) \text{ xor } S_{23,29}(K_5)$   
 $= S_{23,29}(L_0 \text{ xor } L_4 \text{ xor } R_4) \text{ xor } S_{23,29}(Y_0) \text{ xor } S_{31}(L_4) \text{ xor } S_{31}(Y_3) \text{ xor } 1$   
 $S_{23,29}(Y_0) = S_{31}(L_0) \text{ xor } S_{31}(R_0) \text{ xor } S_{31}(K_0) \text{ xor } 1$

$S_{31}(Y_3) = S_{31}(F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } K_1) \text{ xor } K_2) \text{ xor } K_3)$   
 $= S_{23,29}(L_0 \text{ xor } L_4 \text{ xor } R_4) \text{ xor } S_{31}(L_0 \text{ xor } R_0 \text{ xor } L_4) \text{ xor } S_{31}(F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } K_1) \text{ xor } K_2) \text{ xor } K_3)$

Calculating the constants

$\text{constant1} = S_{23,29}(L_0 \text{ xor } L_4 \text{ xor } R_4) \text{ xor } S_{31}(L_0 \text{ xor } R_0 \text{ xor } L_4) \text{ xor } S_{31}(F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } K_1) \text{ xor } K_2) \text{ xor } K_3)$   
 $\text{constant2} = S_{13}(L_0 \text{ xor } L_4 \text{ xor } R_4) \text{ xor } S_{7,15,23,31}(L_0 \text{ xor } R_0 \text{ xor } L_4) \text{ xor } S_{7,15,23,31}(F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } K_1) \text{ xor } K_2) \text{ xor } K_3)$

$\text{constant3} = S_{5,15}(L_0 \text{ xor } L_4 \text{ xor } R_4) \text{ xor } S_7(L_0 \text{ xor } R_0 \text{ xor } L_4) \text{ xor } S_7(F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } K_1) \text{ xor } K_2) \text{ xor } K_3)$

$\text{constant4} = S_{15,21}(L_0 \text{ xor } L_4 \text{ xor } R_4) \text{ xor } S_{23,31}(L_0 \text{ xor } R_0 \text{ xor } L_4) \text{ xor } S_{23,31}(F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } K_1) \text{ xor } K_2) \text{ xor } K_3)$   
 We get,

$S_{5,13,21}(L_0 \text{ xor } L_4 \text{ xor } R_4) \text{ xor } S_{15}(L_0 \text{ xor } R_0 \text{ xor } L_4) \text{ xor } S_{15}(F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } F(L_0 \text{ xor } F(L_0 \text{ xor } R_0 \text{ xor } K_0) \text{ xor } K_1) \text{ xor } K_2) \text{ xor } K_3)$

Since we have found  $K_0$ ,  $K_1$ ,  $K_2$  and  $K_3$ . We can get  $K_4$  and  $K_5$  easily from the relations

K4 = L0 xor R0 xor Y1 xor Y3 xor L4

K5 = L0 xor R0 xor Y1 xor Y3 xor L0 xor Y0 xor Y2 xor R4

Finally we have to check the keys, We can do that from the code shared where it has a method decrypt().

The 256 Valid Key Combinations:
